Before you dive into your neighborhood's statistics, there are some things you need to know:

☐ Navigation

The file for each neighborhood includes several bookmarked sections. To use the bookmarks for convenient access, select the page icon with the blue ribbon in the upper left of your document window.

☐ The Sources

- The **2010 Census Profile** is compiled using data collected during the 2010 US Census door-to-door survey.
- The **ACS** (or American Community Survey) **Housing** and **Population Summaries** were compiled using data collected during 2005 – 2009 by the US Census Bureau using statistical sampling techniques.
- The **Community Profile** and the **Housing Profile** include hard statistics from the 2000 US Census. The accompanying 2010 and 2015 forecasts were generated by specialized geographic information system (GIS) software from a company named Esri.
- The **Executive Summary** pulls information from all of the sources listed above and provides an overview.

☐ Accuracy

When a data source uses forecasts or statistical analysis to generate data, a margin of error is always introduced. As a general rule of thumb, the closer the number crunchers can stay to the actual collected data and the fewer levels of analysis, the more reliable the statistic. Read the data notes at the bottom of each page to better understand how that batch of statistics was created.

Also, the ACS Summaries include a "Reliability" column which evaluates the particular statistic on that line as being of low, medium, or high reliability.

☐ Other Statistics, Other Areas

This set of statistical resources is provided as a courtesy to Lincoln's neighborhood associations. If you want to pursue different statistics or statistics for other areas of Lincoln, that may be possible but please be aware that it will involve paying for the service. Data Note: N/A means not available. Population by Ratio of Income to Poverty Level represents persons for whom poverty status is determined. Household income represents income in 2009, adjusted for inflation.

2005-2009 ACS Estimate: The American Community Survey (ACS) replaces census sample data. Esri is releasing the 2005-2009 ACS estimates, five-year period data collected monthly from January 1, 2005 through December 31, 2009. Although the ACS includes many of the subjects previously covered by the decennial census sample, there are significant differences between the two surveys including fundamental differences in survey design and residency rules.

Margin of error (MOE): The MOE is a measure of the variability of the estimate due to sampling error. MOEs enable the data user to measure the range of uncertainty for each estimate with 90 percent confidence. The range of uncertainty is called the confidence interval, and it is calculated by taking the estimate +/- the MOE. For example, if the ACS reports an estimate of 100 with an MOE of +/- 20, then you can be 90 percent certain the value for the whole population falls between 80 and 120.

Reliability: These symbols represent threshold values that Esri has established from the Coefficients of Variation (CV) to designate the usability of the estimates. The CV measures the amount of sampling error relative to the size of the estimate, expressed as a percentage.

- High Reliability: Small CVs (less than or equal to 12 percent) are flagged green to indicate that the sampling error is small relative to the estimate and the estimate is reasonably reliable.
- Medium Reliability: Estimates with CVs between 12 and 40 are flagged yellow—use with caution.
- Low Reliability: Large CVs (over 40 percent) are flagged red to indicate that the sampling error is large relative to the estimate. The estimate is considered very unreliable.

2005-2009 ACS Estimate: The American Community Survey (ACS) replaces census sample data. Esri is releasing the 2005-2009 ACS estimates, five-year period data collected monthly from January 1, 2005 through December 31, 2009. Although the ACS includes many of the subjects previously covered by the decennial census sample, there are significant differences between the two surveys including fundamental differences in survey design and residency rules.

Margin of error (MOE): The MOE is a measure of the variability of the estimate due to sampling error. MOEs enable the data user to measure the range of uncertainty for each estimate with 90 percent confidence. The range of uncertainty is called the confidence interval, and it is calculated by taking the estimate +/- the MOE. For example, if the ACS reports an estimate of 100 with an MOE of +/- 20, then you can be 90 percent certain the value for the whole population falls between 80 and 120.

Reliability: These symbols represent threshold values that Esri has established from the Coefficients of Variation (CV) to designate the usability of the estimates. The CV measures the amount of sampling error relative to the size of the estimate, expressed as a percentage.

- High Reliability: Small CVs (less than or equal to 12 percent) are flagged green to indicate that the sampling error is small relative to the estimate and the estimate is reasonably reliable.
- Medium Reliability: Estimates with CVs between 12 and 40 are flagged yellow—use with caution.
- Low Reliability: Large CVs (over 40 percent) are flagged red to indicate that the sampling error is large relative to the estimate. The estimate is considered very unreliable.
