

LINCOLN WATER SYSTEMS

PROJECT CONTACTS

When Water initiates a project, with E.S. the LWS single point of contact is identified. For distribution mains, it is never Meints, and seldom Miriofsky. The LWS contact is also identified on the CIP Delivery database maintained by Engineering Services.

For the past year, **Owen** has managed all of the **Selected Main Replacement** projects.

McElvain has handled most of the remaining **Distribution** projects, including developer negotiations.

Miriofsky handles **Pump Stations, Treatment Plant, Wellfield, Transmission Mains, Service Center and other building projects**, etc. We are working together on the new Cheney Booster Reservoir and the Greenwood to Lincoln Transmission Main project.

Thurber handles the **Security** projects.

Meints is the contact for **shut downs, tapping sleeve and valves, and disinfection** after testing is completed on all distribution projects until the staff revisions noted in item 8.

If you have question on any of the above items, please let me know. Jerry O.
